

Cooldown

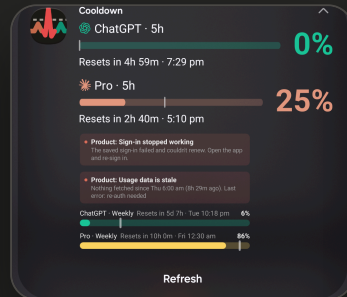

an always-on companion for people who live in Claude & ChatGPT

Never get cut off by a usage limit **mid-thought** again.

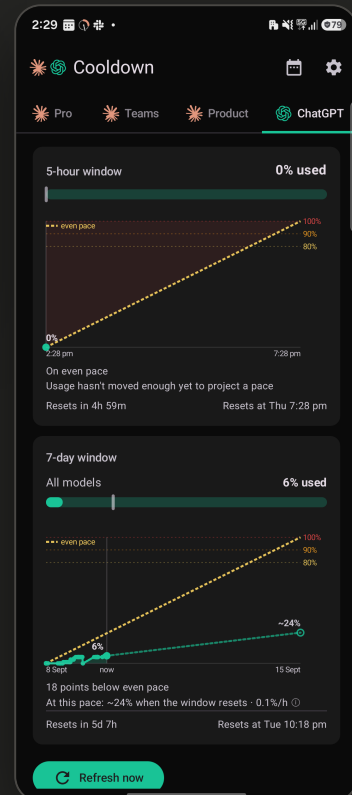

Claude and ChatGPT both meter you on a 5-hour session window and a 7-day weekly one. Cooldown keeps them in your Android shade – **two accounts on one always-on notification**, a ring in the status bar, as many accounts as you use on either service – forecasts when you'll hit the wall at your current pace, and pings you the moment you're back.

The app – a Claude account in its ivory room, pace chart and all

The notification – two accounts, expanded, visible from inside any app

A ChatGPT account – the same cards in its own neutral room

CLAUDE + CHATGPT

ALWAYS-ON NOTIFICATION

STATUS-BAR RING

PACE CHART

RESET PINGS

NO SERVERS

Built with Claude Code – by two Claude models. Prototyped over a week and **built in a single weekend by Claude Fable 5** (every line of Kotlin, the UI, the notification). When the sign-in hit a wall Fable wouldn't cross, **Claude Opus 4.8** stepped in to finish it and write the docs. Directed by Robin Richard Rajan – this brochure too.

What it **does**

Two accounts, one notification

Always-on and silent: a First and a Second account side by side, each with its mark, bar and big percentage.

The status-bar ring

A tiny ring fills with the 5-hour window, in the account's own colour so you know whose it is.

The pace chart

Every reading plotted, with a forecast tail: "At this pace: 100% at Thu 2:40 PM – 1h 20m before the reset."

Reset pings

Per account and per window – Off, If busy, or Always – so you know the moment you're back.

The even-pace line

One diagonal across each chart, one tick on every bar. Below it you'll finish inside your limit.

Claude and ChatGPT

Pick the service when you add an account, then mix as many as you like – each in its own room: ivory and serif for Claude, neutral for ChatGPT.

Sign in on the phone

Claude uses the OAuth flow Claude Code does; ChatGPT takes a short code you approve at auth.openai.com. No computer, no copied tokens.

Usage credits

Pay-as-you-go credits get their own card – spent, total and what's left, or a plain balance on ChatGPT. Plans without them never see it.

Private & backed up

No servers or telemetry; the token is Keystore-encrypted. History & settings survive a reinstall (token excluded).

How it was **made**

Cooldown exists because of one recurring pain: deep in a Claude chat, a Cowork run or a ChatGPT session, the dreaded "*approaching your limit*" – with no idea how close, or when the window resets. Claude Code can tell you; the chat apps can't. The fix: put the answer where your eyes already are.

Claude Fable 5 built it – in a weekend. After a week of throwaway prototypes, one weekend turned it real: pushed to git, signed, running on a phone. Fable wrote virtually everything – the app, the notification, the alert logic, the reverse-engineered usage API.

Then it hit the one wall Fable wouldn't cross: the OAuth **sign-in handshake**, which Fable declined on cybersecurity grounds. **Claude Opus 4.8** stepped in – built the native sign-in the app now uses, and wrote the docs Fable left undone. **Claude Opus 5** shipped v1.1's pace chart and credits, then v1.5's ChatGPT accounts on the same rails; **Claude Fable 5.1** ran v1.6 – the two-account notification and the Pulse tile. If you pay for Claude, you already have the engineer... or four.

v1.6

two accounts on one notification

1

weekend to a working build on a real phone

Want it on your phone?

It's **free & open-source**. Scan the code (or visit github.com/robineam360/Cooldown), grab the **latest APK** from the Releases page, and follow the **detailed user guide** – install → sign-in → notification in ~3 minutes. **Android 12+ today; iOS is on the roadmap.**

And if the "built by Claude" part is what got you curious – even better. Bring an idea of your own; it takes fewer evenings than you'd think.
