Cooldown

an always-on companion for people who live in Claude & ChatGPT

Never get cut off by a usage limit mid-thought again.

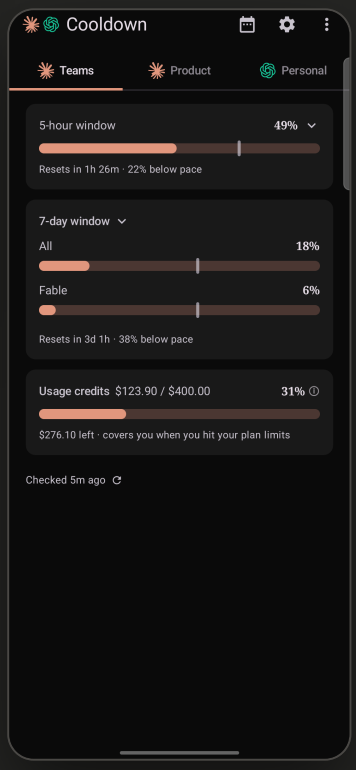

Claude and ChatGPT both meter you on a 5-hour session window and a 7-day weekly one. Cooldown keeps them in your Android shade — **two accounts on one always-on notification, a ring in the status bar**, as many accounts as you use on either service — forecasts when you'll hit the wall at your current pace, and pings you the moment you're back.

The app, redesigned — a Claude account, Compact-ready cards

The notification — two accounts, expanded, visible from inside any app

Compact density — every card in reach, tap to expand

CLAUDE + CHATGPT · ALWAYS-ON NOTIFICATION · STATUS-BAR RING · PACE CHART · RESET PINGS · NO SERVERS

New in v1.9: steadier underneath. A crash report **stays on your phone until you share it**, the sign-in store recovers instead of crashing, and a **privacy policy** on the About card lists every host the app talks to.

What it **does**

📌

Two accounts, one notification

Always-on and silent: a First and a Second account side by side, each with its mark, bar and big percentage.

◎

The status-bar ring

A tiny ring fills with the 5-hour window, in the account's own colour so you know whose it is.

📈

The pace chart

Every reading plotted, sized and oriented your way, with a forecast tail: "100% at Thu 2:40 PM – 1h 20m before the reset."

🔔

Reset pings

Per account and per window – Off, If busy, or Always – so you know the moment you're back.

📐

Your layout, your call

Comfortable or Compact density; reorder, hide, or fold any card behind More – Reset layout undoes it in one tap.

👥

Claude *and* ChatGPT

Pick the service when you add an account, then mix as many as you like – each in its own room: ivory and serif for Claude, neutral for ChatGPT.

🔐

Sign in on the phone

Claude uses the OAuth flow Claude Code does; ChatGPT takes a short code you approve at auth.openai.com. No computer, no copied tokens.

📊

Plan Fit

Is this plan the right size? Read off your last eight closed weeks on the History tab – no dollar guesses, just the pattern.

💾

Private & backed up

No servers or telemetry; the token is Keystore-encrypted. History & settings survive a reinstall (token excluded).

Why it **exists**

Cooldown exists because of one recurring pain: deep in a Claude chat, a Cowork run or a ChatGPT session, the dreaded *"approaching your limit"* – with no idea how close, or when the window resets. Claude Code can tell you; the chat apps can't. The fix: put the answer where your eyes already are.

Widgets spread that answer further – Ring, Number, Countdown and All accounts, each one sized to whatever cell you drop it in, from a single square to a full row, so the number is visible without even opening the shade.

v1.9 makes it steadier. If the app ever crashes, a card offers the report – it goes only where you send it, with no tokens or emails in it. If Android's secure storage stops answering, Cooldown says so plainly and keeps your sign-ins safe on the phone instead of losing them.

v1.9
crash reports that stay on the phone

4
widget faces – Ring, Number, Countdown, All

2
services tracked – Claude and ChatGPT

0
servers, trackers or analytics

Want it on your phone?

It's **free & open-source**. Scan the code (or visit **github.com/robineam360/Cooldown**), grab the **latest APK** from the Releases page, and follow the **detailed user guide** – install → sign-in → notification in ~3 minutes. **Android 12+ today; iOS is on the roadmap.**

Free, open-source and yours to keep – no account, no subscription, no catch.

Sideloaded personal app, not on any store · tokens encrypted on-device · **unofficial** – uses the Claude Code and Codex CLIs' clients against undocumented usage endpoints · **not affiliated with or endorsed by Anthropic, OpenAI or Google** · Robin Richard Rajan · v1.9, November 2026
