Cooldown

Your Claude *and* ChatGPT limits, always in your Android shade — two accounts on one notification, a ring in the status bar, a ping when a window resets.

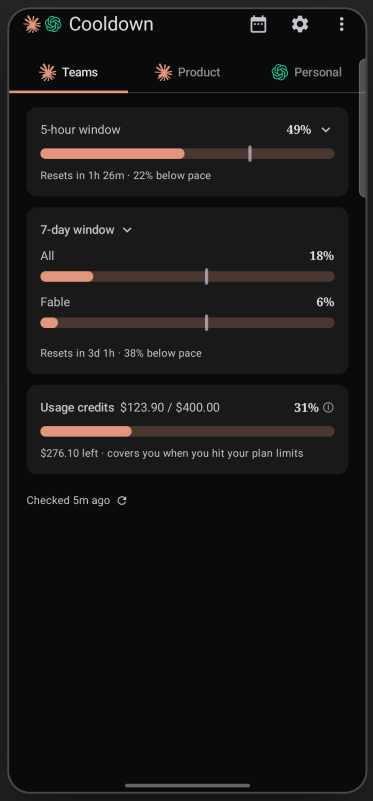

CLAUDE + CHATGPT · ALWAYS-ON NOTIFICATION · STATUS-BAR RING · PACE CHART · RESET PINGS · MULTI-ACCOUNT

The app — a Claude account, in its room

The notification — two accounts, expanded

Compact density — every card in reach

Before you install: this is an **unofficial** personal tool — it signs in to Claude with the **same OAuth client as the Claude Code CLI**, and to ChatGPT with the **Codex CLI's**, both against **undocumented** usage endpoints, so there's a small risk either could **revoke the token or flag the account**. It's read-only and signs in once; full detail on **page 4**. Use it at your own discretion.

Version 1.9 · November 2026
Built by Robin Richard Rajan
Personal sideloaded app — not on any store · not affiliated with Anthropic, OpenAI or Google

What it is & what's inside

Cooldown is a personal Android app for your **Claude** and **ChatGPT** plan limits — for **as many accounts as you use**, on either service. It shows the 5-hour and weekly rolling windows for each account (including per-model caps like Fable and Spark), when each resets, how far into the week you are, and forecasts *when* you'll hit a limit at your current pace. Its home is the **always-on notification**: two accounts side by side in the shade, a ring in the status bar, and a ping the moment a window resets.

📌 Always-on notification
TWO ACCOUNTS

One silent notification carries a First and a Second account — each with its mark, bar and big percentage. Expand it for the weekly rows and per-model caps.

◎ Status-bar ring
A tiny ring that fills with the 5-hour window, coloured in the account's own colour so you know whose it is — First, Second, or whichever is higher.

🔔 Reset pings
Per account and per window, Off / If busy / Always — the one notification that still posts on its own, so you know the moment you're back.

📈 Pace chart
Every reading plotted against an *even-pace* line — stay below it and you finish the window inside your limit.

👥 Claude + ChatGPT
Add as many accounts as you use, on either service — each in its own *room*: warm ivory and serif figures for Claude, cool neutral for ChatGPT.

📅 Usage history
A scrollable bar for every 5-hour session, week by week — see how many you ran and which hit 100%.

💳 Usage credits
Pay-as-you-go credits as their own card — spent, total and what's left. Hidden if your plan has none.

🔒 Private, and backed up
No servers or telemetry; the token is Keystore-encrypted. History & settings survive a reinstall (token excluded).

New in v1.9

what changed since v1.8

Crash reports stay on your phone

- If Cooldown crashes or stops responding, the next time you open it a card under the top bar says so – *"Cooldown crashed today at 6:17 PM"* (CCRM-85 (Crash Capture)).
- **Share report** sends it wherever you pick – an email, a chat. The card goes once you pick an app; backing out of the share sheet keeps it. **Not now** puts it away.
- A report holds the error's type, the code locations, and the app, Android and phone versions. **Error messages are left out**, and it is scrubbed for anything that looks like a token or an email.
- Nothing is sent on its own – there is no crash service. Behind the 7-tap unlock, **Diagnostics → Crash reports** keeps them for 30 days, with Share and Delete.

A steadier sign-in store

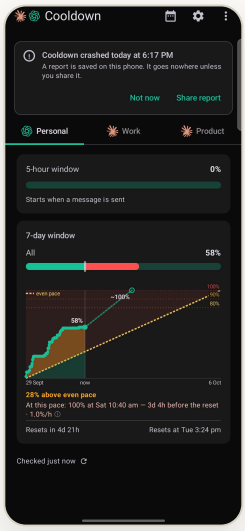

- If Android's secure storage breaks for good, Cooldown no longer crashes at every launch: it clears the unreadable sign-ins, says so, and you sign in again (CCBG-46 (Keystore Wedge)).
- If storage only stops responding, an amber notice says so on the main screen and in Settings → Accounts, with **Try again**. Your saved sign-ins stay on the phone and come back once storage answers.
- A sign-in or sign-out made meanwhile lasts until the app restarts; a one-time card afterwards tells you which (CCBG-50 (Degraded Store Notice)).

Privacy

- A **Privacy policy** row in Settings → More → About, under Share feedback. The policy lists every host the app talks to and everything it keeps (CCRM-89 (Privacy Policy)).
- Cooldown no longer holds the permission to see every app installed on the phone; the sign-in browser picker still lists your browsers (CCRM-88 (Scoped Queries)).

Fixed underneath

- CCBG-35 (Tab Clip) – Settings tab titles are never cut off on a narrow phone or at a large font; the row scrolls instead.
- CCBG-45 (Single Panel Wording) – the one-account notification says "5h" and "Weekly", like the two-account one.
- CCBG-48 (Reconfigure Label) – a widget's settings opened later say "Save changes", not "Add widget".
- CCBG-52 (Boot Pin Delay) – after a reboot the always-on notification comes back promptly, not minutes later.

The crash card, above the account tabs

Updating from v1.0–v1.8 is in place – same signing key; sign-ins, history, widgets and settings all survive.

1 Install

Android 12+ · sideloaded APK · about a minute

Before you install — the honest part. Claude: to read your usage, Cooldown signs in with the **same OAuth client as the Claude Code CLI** (identical client ID and scopes) — that's how the phone sign-in has always worked. Usage polls send Cooldown's own honest User-Agent, `Cooldown/<version> (Android)`, not the CLI's — an earlier build borrowed the CLI's identity there too, out of an untested throttling fear that didn't hold up, so v1.7 dropped it (CCRM-68 (Honest Agent)). **ChatGPT:** mints **its own token** via OpenAI's device-code flow using the **Codex CLI's client ID**, reads an **undocumented** endpoint, and has always identified itself honestly as Cooldown. Neither endpoint is documented for third-party use, and both companies' consumer terms restrict third-party tools on consumer tokens, so installing means accepting a small but real risk that either could **revoke the token or flag the account**. What limits it: the app is **read-only** (never sends prompts or spends quota), signs in **once per install**, and is shared privately — never on a store. Use it at your own discretion.

1. Download the **APK** onto the phone from the **latest GitHub release** (*github.com/robineam360/Cooldown/releases/latest*). In-app, **Settings → More → Check for updates** links you straight to it.
2. Tap the APK. When Android warns about unknown apps, **allow installs from the app you opened it with**, then tap **Install**. A Play Protect "scan app?" prompt may appear — scan or install anyway; you know where this one came from.
3. Open **Cooldown** and **allow notifications** when asked — that's what powers the always-on notification and the reset pings.

Updating an existing install? From v0.13 onward, just install the new APK over it — sign-ins, settings and history survive. **Widgets are back as of v1.8**, as a new suite — add them fresh from the picker; nothing placed before v1.6 returns on its own, and the **Quick Settings tile stays removed**. (Coming from v0.12 or earlier needs a one-time uninstall + reinstall — the signing key is permanent from v0.13 on.)

2 Connect your accounts

Personal and Work by default — add as many more as you use

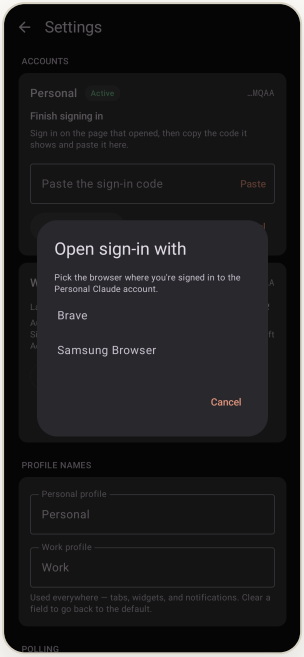

The app starts with two account cards, **Personal** and **Work** — each with its own sign-in, polling, tab and reset pings. Tap **"+ Add account"** on the **Accounts** tab of Settings for a third, fourth, or more; each new one gets an editable name too. Every profile signs in **right on the phone — no computer needed**:

1. Open ⚙ **Settings → Accounts** and tap **"Sign in on this phone"** on the account's card.
2. If you have several browsers, a picker appears — **choose the browser where that account is already logged in** to claude.ai (e.g. Work in Chrome, Personal in Brave). That's how you control *which* account gets connected.
3. The browser opens Claude's sign-in. Log in if needed, then tap **Authorize**.
4. The page shows a **code** — tap **Copy**, switch back to the app, tap **Paste**, then **Finish sign-in**.
5. The card turns **Active** and usage loads: *"signed in — usage fetched, polling started."*

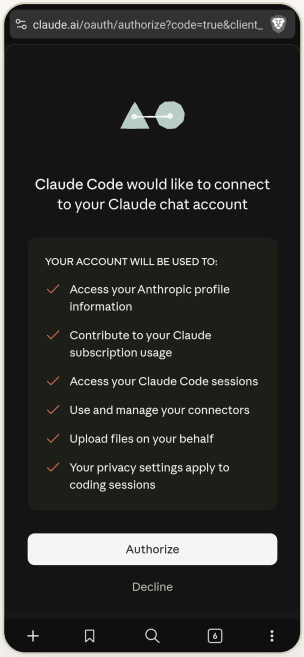

Works for **Pro / Max** and **Team** accounts alike, on any card — **not Free**: a Free account signs in, but Anthropic's usage endpoint refuses it (HTTP 403), so the card says *"Claude doesn't report usage for the Free plan"* and shows no numbers until the plan changes. The card also wears the plan — **Pro, Max, Team Standard, Team Premium** — read from the account's profile. The sign-in is minted on the phone and is yours alone — no computer shares it, so nothing can rotate it away. It self-renews for about **a month** (the card shows *"Sign-in expires around …"*), and renewing is the same one-minute flow via **"Re-sign in"**. An account with no token yet carries no tab — it appears the moment it's signed in.

2 Sign-in, step by step

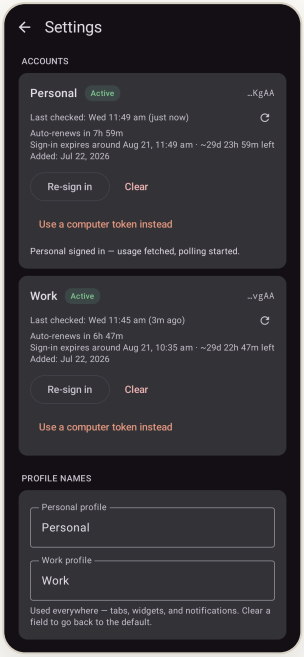

What you'll see on screen

1 – Tap "Sign in on this phone", then pick your browser

2 – Authorize in the browser (the standard Claude consent page)

3 – Paste the code, Finish – signed in, usage loads, polling runs

Why the browser picker matters

The sign-in lands on whatever claude.ai account that browser is logged into. Keeping **Work in Chrome** and **Personal in another browser** gives you a clean, repeatable way to connect each profile to the right account – no logging in and out.

What the card shows afterwards

- Status chip – **Active** / Needs re-auth
- Plan badge – Pro, Max or Team
- The email it signed in with, under the account name (CCBG-34 (Account Display Name))
- Last checked, with a one-tap "check now" button
- Auto-renew countdown & last auto-renewed time
- "Sign-in expires around …" (≈30-day estimate)

The screens above are from an earlier version – the cards and the sign-in flow are unchanged, the Settings screen around them now has four tabs (page 10).

Token safety: the sign-in is stored **encrypted on the phone only** (Android Keystore) and is never sent anywhere except Anthropic's own API. No servers, no telemetry, no analytics – nothing else ever sees it.

2 ChatGPT: sign in with a code

A short code, typed on this phone or any other device

A ChatGPT account is added the same way as a Claude one, and behaves the same way afterwards – its own tab, its half of the notification, its reset pings and history. Only the sign-in differs: instead of a browser round-trip and a pasted code, OpenAI shows you a **short code** to approve.

Once, before your first ChatGPT sign-in: turn on **"Enable device code sign-in for Codex, Excel, PowerPoint, and Word"** in ChatGPT → **Settings** → **Security** (chatgpt.com/security-settings; the sheet links to it). It is off by default, and while it is off the code is never accepted. On a work account, your workspace admin has to allow it.

1. In ⚙ **Settings** → **Accounts**, tap **"+ Add account"**. A sheet lists the three services – pick **ChatGPT**.
2. The app shows a **code** in large type and a **countdown** (the code is good for 15 minutes). Tap **Copy code** if you like.
3. Go to **auth.openai.com/codex/device** – tap **Open in browser** to do it right here, or type the address on your laptop. Either works; the code is not tied to this phone.
4. Log in to ChatGPT if needed, enter the code, and approve.
5. The sheet closes by itself and the new tab appears with your usage already loaded.

If something goes wrong

- **The code expired** – the countdown ran out, or ChatGPT's device code setting is off (above). Tap **"Get a new code"**; nothing is lost.
- **Denied** – the approval was rejected in the browser. Start again.
- **Unavailable** – OpenAI has the device flow switched off. Rare; the sheet tells you what to do.
- **You closed the app mid-flow** – reopen it and the sheet comes back where it was, still counting down.

What the card shows afterwards

- The **ChatGPT mark** before the account name
- Status chip – **Active** / Needs re-auth
- Plan badge – Plus, Pro, Team, Business…
- The email it signed in with, under the name
- Buttons: **Sign in with a code** · **Refresh** · **Clear**
- **No** "expires around …" line – see the note below

How a ChatGPT tab reads differently

Mostly it doesn't – the same bars, the same pace chart. Three differences worth knowing:

- **A window you don't have isn't drawn.** OpenAI suspended the 5-hour limit on some plans; if yours has no 5-hour window, that card simply isn't there – no dash, no empty bar. On the notification that account's headline is its **Weekly** window instead. (Claude accounts follow the same rule.)
- **Extra caps** such as **Spark** appear as per-model rows under the weekly card, exactly like Claude's per-model caps.
- **Credits** show as a plain **"$12.40 balance"** rather than a spent/total bar – OpenAI reports a balance, not a monthly cap. An unlimited plan shows nothing at all.

> **Why there's no expiry countdown.** A Claude sign-in has a predictable ~30-day life, so the app shows one. OpenAI's has no published lifetime, and a wrong estimate is worse than none – so the app stays quiet and simply tells you if a refresh ever fails.

> **The phone mints its own sign-in.** Nothing is copied from a computer – and deliberately so: reusing the token your desktop Codex CLI holds would trip OpenAI's rotation detection and sign you out of your own CLI. There is no paste or QR option for ChatGPT, and that's the reason.

> **Gemini is greyed out.** The third row in the Add-account sheet is Google's Antigravity (Gemini). Its sign-in can't be completed on a phone today – Google's flow needs a callback only a desktop can answer. The row is shown, disabled, rather than hidden, so you know it's known about. It'll light up if that changes.

3 Reading the screens

One tab per signed-in account – swipe or tap to switch

Row style, chevron, Compact

Every card leads with a bold title row and its headline figure, then the bar with its pace mark. **Comfortable** keeps the chart open below it. **Compact** folds the same card to that title row, the bar and one line – *"Resets in 2h 41m · 32% below pace"* – with a trailing chevron; tap the card to open its chart in place. Pick the density under **Appearance**; each card remembers whether you opened it.

The 7-day card: All or a cap

Chips above the chart – **All** plus one per per-model cap your plan reports (**Fable**, Sonnet, Opus) – pick which series the chart, pace line and estimate follow; every cap's bar stays on the card whichever one is charted. On the wide inner screen the toggle becomes two chart columns, All beside the cap, side by side.

Main screen layout

The top bar's ⋮ opens **Main screen layout**: one row per card with a show/hide switch and a drag handle, and a *Behind More* divider a card can be dragged under. At least one card always stays visible above More. **Reset layout** undoes any of it.

One status line

One row under the cards replaces the Refresh button and the two timestamps: *"Checked just now · ↻"* – a spinner while refreshing, *"Tried 2m ago"* only if the last attempt failed after the last success.

The pace chart

A **dot for each reading**, dashed guides at **80 / 90 / 100%**, a marker on the latest figure and a dashed forecast tail – now drawn with its guide labels **inside the plot**, so the chart's now-line sits exactly under the bar's pace mark. **Chart height** (Small keeps just the lines and drops every label; Medium is the default; Large draws everything) and **Chart orientation** (Time across, or Time down the bar's own axis) both live in Appearance.

The even-pace line – the one to watch

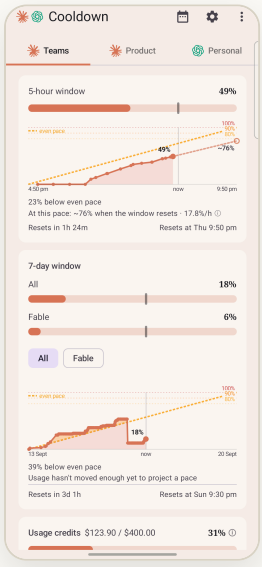

The dashed **yellow diagonal** runs from 0% at the window's start to 100% at reset: below it, you'll finish inside your limit; above it, the overshoot **shades amber**. The readout reads in **%**, not "points" – *"33% below even pace"*. The same tick sits on every bar; **Appearance → Show red past the pace mark** colours the bar beyond it.

Burn-rate forecast

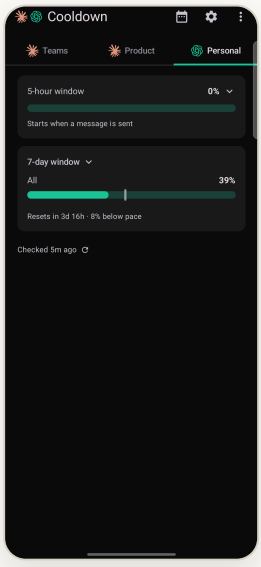

After ~20 minutes of history and some movement: *"100% at Thu 2:40 PM – 1h 20m before the reset"* in red when you're heading for the wall, or a safe percentage otherwise. It fits a line across **every** reading, so one early burst won't skew it.

Credits, History, Plan Fit

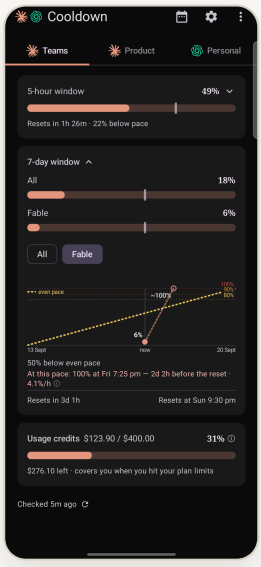

Plans with pay-as-you-go credits get a third card – no chevron, since it has no chart. The **calendar icon** opens **Usage history**: a bar for every session, kept a year, and on the 7-day tab, **Plan Fit** – is this plan the right size, read off your last eight closed weeks.

Claude, light theme – row style, bar, chart

ChatGPT, dark theme – the same card grammar

Compact, 7-day card charting the Fable cap

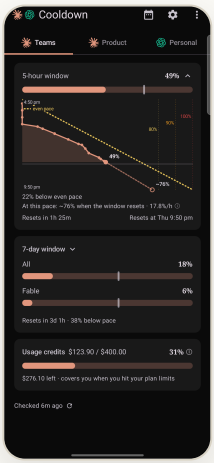

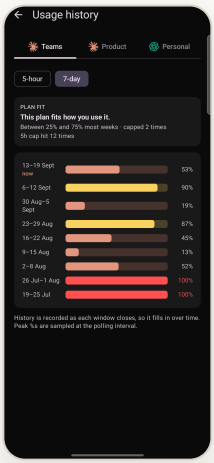

Chart orientation: Time down

Usage history – Plan Fit up top

4 Widgets

Home-screen, in any size you give them — CCRM-78 (Widgets Reborn)

Adding one

Long-press the home screen → Widgets → **Cooldown**, drag one onto a page at any size from 1×1 to a full row, and drop it. Its settings sheet opens right away — pick the **account**, the **window** (5h or Weekly) and the **background** (Solid, Gradient or Transparent). Change any of them later from the widget's own long-press **Settings**.

The four faces

- **Ring** — one account as a gauge, filling with its window (CCRM-79 (Ring Face))
- **Number** — the big percentage, like the pinned notification (CCRM-80 (Number Face))
- **Countdown** — when the window comes back, ticking live (CCRM-81 (Countdown Face))
- **All accounts** — every account as its own ring, side by side — never a sum (CCRM-82 (Accounts Strip))

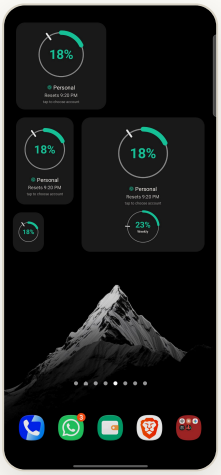

Fills whatever size you give it

From 1×1 to a full row. Bigger Rings add the reset time and a second, smaller ring for the other window; the Number's 2×2 and 4×2 sizes carry **5h | Weekly** chips and an account switcher; the Countdown's count grows with the widget (CCBG-44 (Widget Fill)). The same ring the status bar draws is now painted by one renderer everywhere (CCRM-83 (Ring Renderer)).

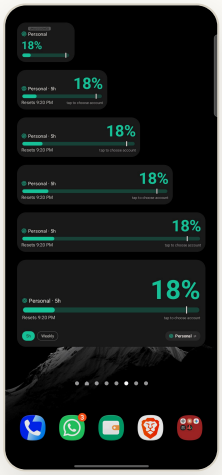

Keeping it fresh

If you use widgets without the always-on notification, add Cooldown to One UI's **Never sleeping apps** (Settings → Battery → Background usage limits) — otherwise the OS can pause the background poll that keeps them current.

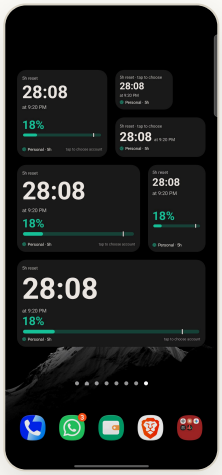

> **Widgets from before v1.6 don't come back.** Anything placed on an earlier version is long gone; add the new ones fresh from the picker. The Quick Settings tile stays removed — the notification and the widgets cover that job between them.

Ring

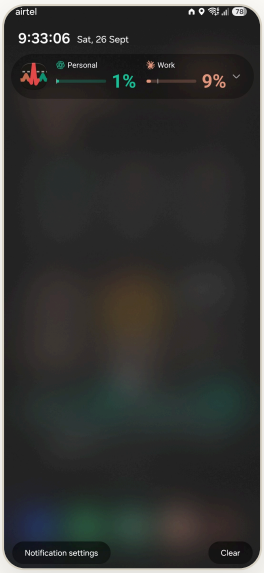

Number

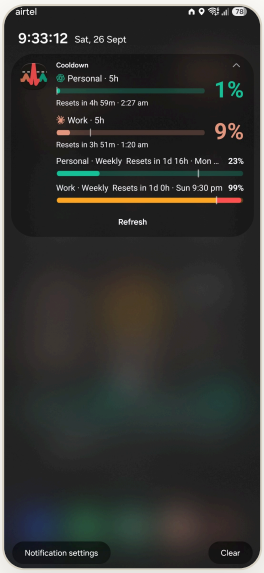

Countdown

5 The always-on notification

Two accounts in the shade, a ring in the status bar – usage without opening anything

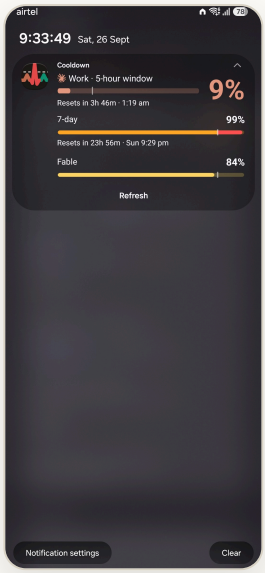

Two accounts, collapsed – mark, name, bar, 5-hour figure

Two accounts, expanded – reset lines, Weekly rows, Refresh

One account, collapsed

One account, expanded

Two accounts, one row

Turn it on under **Settings → Alerts → Always-on notification** and pick a **First** and, optionally, a **Second** account under **Show accounts**. Collapsed, each half shows the provider's mark, the account name, an 8 dp bar with the neutral pace tick, and the 5-hour percentage in that half's colour – your account's own until 80%, then yellow, orange, red. An account with no 5-hour window shows its **Weekly** figure instead. With one account, or Second set to None, you get the single layout.

Expanded

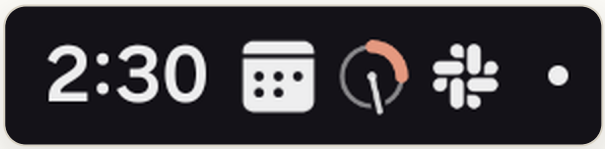

Two header blocks – *"Personal · 5h"*, *"ChatGPT · Weekly"* – each with a bigger bar, the reset line and a 36 sp figure; then the panel: each account's **Weekly** row and, when something needs saying, one condition strip (per-model caps stay in the app). The panel is drawn at full width whatever it holds. **Refresh** is the one action. The wording is always **5h** and **Weekly**.

Tapping it

Each half is its own target: it opens Cooldown on that account's tab – or, if you choose so under **Tapping a number opens**, that service's own app.

The status-bar ring

The tiny icon is a **ring** that fills with the shown account's 5-hour window, drawn in that account's colour – so the colour tells you *whose* it is. It steps through yellow, orange and red as the window fills; at **100%** it goes solid red with an **×** in the middle. **Status-bar ring shows** picks First, Second, or **Whichever is higher** – the last one may switch during the day, and the colour change is the tell.

The ring in the status bar

Reset pings

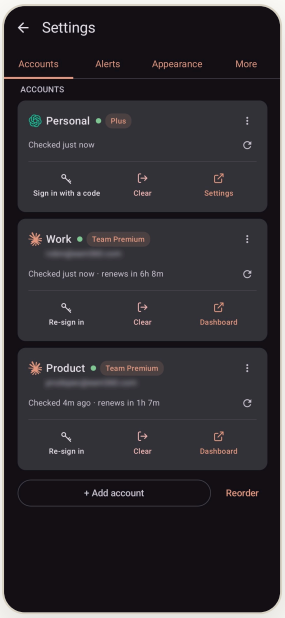

The one notification that still posts on its own. For each account, set the **5h reset** and the **Weekly reset** to **Off / If busy / Always** under **Settings → Alerts → Reset pings**. *If busy* pings only when that window had reached 80% before it reset – which kills most of the noise. An account left idle across the reset pings too.

Conditions

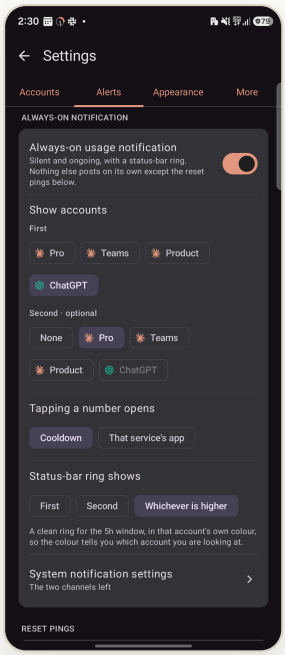

If an account's sign-in stops working, its data has gone stale for six hours, or an update is available, a small **dot** appears after its name collapsed and a labelled **strip** in the expanded panel. Nothing else posts separately.

6 Settings reference

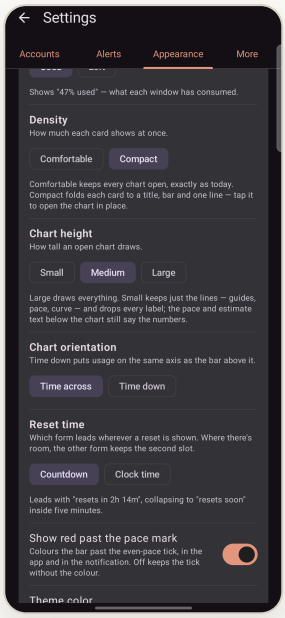

Four swipeable tabs — Accounts · Alerts · Appearance · More

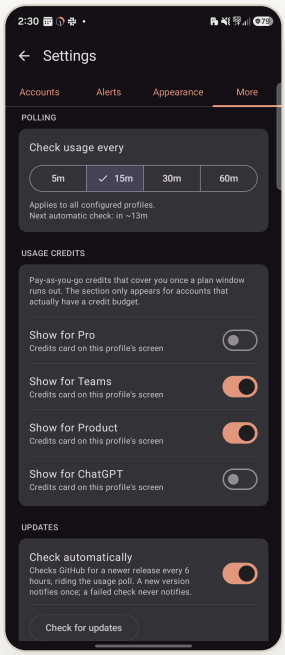

Accounts — cards with the email shown under each name

Alerts — the notification, the ring, reset pings

Appearance — density, chart height & orientation

More — polling, updates, About

TAB · SETTING	WHAT IT DOES
Accounts	Redesigned, shorter cards (CCRM-65 (Accounts Redesign)): mark · label · status dot · plan chip · ⋮. A status line ("Checked just now · renews in 1h 9m") plus a conditional line only when something needs saying — Free plan, renewal stopped, or a sign-in expiring inside 3 days. Each card also shows the **email** it signed in with, under its name (CCBG-34 (Account Display Name)). Three action cells — **Re-sign in · Clear · Dashboard** (ChatGPT: Sign in with a code · Clear · Settings). The ⋮ menu: Details, Rename, Accent colour, Remove account, **Clear usage history…** (CCRM-14 (Clear History)). **"+ Add account"** and **Reorder** — drag accounts into your own order (CCRM-71 (Account Order)) — sit at the bottom.
Alerts · Always-on	The always-on notification on/off, and **Show accounts**: a **First** chip row and a **Second · optional** one (None to run single).
Alerts · Tapping	**Tapping a number opens** Cooldown on that account's tab, or that service's app.
Alerts · Ring	**Status-bar ring shows** First / Second / Whichever is higher. **System notification settings** opens Android's per-channel controls.
Alerts · Reset pings	Per account: **5h reset** and **Weekly reset**, each Off / If busy / Always.
Appearance	**Theme** System / Light / Dark (Claude's dark theme now sits on true black (CCRM-76 (Black Room))) · **Density** Comfortable / Compact (CCRM-72 (Main Screen Redesign)) · **Chart height** Small / Medium (default) / Large (CCRM-75 (Chart Height)) · **Chart orientation** Time across / Time down (CCRM-77 (Transposed Chart)) · **Time format** 12-hour / 24-hour · **Usage display** Used / Left · **Reset time** Countdown / Clock time · **Show red past the pace mark**, one switch for the app and the notification · **Theme colour**: Per provider (default), Material You, Claude Orange and twelve more.
More	**Polling** every 5 / 15 / 30 / 60 min · **Usage credits**, a card switch per account — the section only appears for accounts that have a credit budget · **Updates** with **Check for updates** (asks GitHub for the latest release) · **About**: version, credits, Share feedback, **Privacy policy** (CCRM-89 (Privacy Policy)), **Share snapshot** (CCRM-24 (Share Card)). Tap the version 7× and **Diagnostics** (share your log; **Crash reports**, kept 30 days, when there are any) and a **Debug** section append below.

On the Fold's inner screen each tab lays its cards out in two columns. Swipe between tabs or tap their names.

7 Troubleshooting & privacy

SYMPTOM	MEANING / FIX
A half is dimmed, "stale" strip	Polls for that account have failed for six hours – you're seeing the last known numbers, never a blank. Usually temporary; self-heals on the next successful poll.
"Re-auth needed"	The token and its refresh both failed. Tap **"Re-sign in"** on that card. The notification shows a dot and a strip until it's fixed.
"Claude doesn't report usage for the Free plan"	The account is on Claude's Free plan, or a Pro plan that lapsed. Anthropic refuses Free organisations at the usage endpoint; the app names the plan and re-checks it every poll. Upgrade to Pro, Max or Team, or remove the account.
"Rate limited (429)"	The API asked us to back off; automatic retries with increasing delays (5 min → 1 h max).
"Token refresh failed (HTTP 429)"	A *dead* refresh token, not real rate-limiting – Anthropic answers 429 for one. Fix: **"Re-sign in"** on that card.
My Quick Settings tile is gone	Removed for good in v1.6 – nothing brings it back. Home-screen widgets returned in v1.8 as a new suite; add them fresh from the widget picker.
A widget stopped refreshing	Add Cooldown to One UI's **Never sleeping apps** (Settings → Battery → Background usage limits), especially if you don't also run the always-on notification.
"Cooldown can't open your saved sign-ins"	Android's secure storage isn't responding. Your sign-ins are still on the phone and come back by themselves once it answers; **Try again** re-checks now. A sign-in made meanwhile lasts only until the app restarts.
A "Cooldown crashed" card	The app crashed or froze last time. **Share report** and send it to the developer (the About card's Share feedback address) – it holds no token or email. **Not now** puts it away.
No reset ping arrived	Check notification permission, that the account's **5h** / **Weekly** reset isn't Off, and that *If busy* isn't hiding a window that never reached 80%.
Anything else	Settings → More → **Diagnostics** shares the app log; the Debug section (7 taps on the version) shows the last raw response.

Privacy & good-to-know

- **No servers, no telemetry, no analytics.** The app talks only to `api.anthropic.com` (usage), `platform.claude.com` (sign-in code exchange + token refresh), `claude.com` (the sign-in page in your browser), `auth.openai.com` (the device-code sign-in) and `chatgpt.com` (usage) – plus, in the GitHub build only, `api.github.com` to check for a newer release. The **Privacy policy** row on the About card lists every host and everything kept.
- Tokens live in **Android-Keystore-encrypted storage**; cached usage numbers contain nothing sensitive.
- A crash report stays on your phone until you share it.
- Polling is deliberately gentle – 15-minute default, 3-minute manual floor, exponential backoff on 429s.
- Reading either usage API with a consumer token outside the official clients is not covered by Anthropic's or OpenAI's consumer terms; personal-use risk was accepted when this was built.
- Not affiliated with or endorsed by Anthropic, OpenAI or Google. Sideload-only, free, no accounts, no strings.

8 Version history & dev notes

VER.	HIGHLIGHTS
1.9	**Crash reports that stay on the phone, a steadier sign-in store, a privacy policy.** After a crash or a freeze, a card offers **Share report** – the report goes only where you send it, without error messages, tokens or emails (CCRM-85 (Crash Capture)). A broken credential store no longer crashes the app at every launch (CCBG-46 (Keystore Wedge)); when secure storage stops responding, an amber notice says so, with **Try again** (CCBG-50 (Degraded Store Notice)). A **Privacy policy** row on the About card (CCRM-89 (Privacy Policy)); no more access to the full list of installed apps (CCRM-88 (Scoped Queries)). **Fixed:** Settings tab titles are never cut off (CCBG-35 (Tab Clip)); "5h" and "Weekly" on the one-account notification (CCBG-45 (Single Panel Wording)); "Save changes" on a widget's settings (CCBG-48 (Reconfigure Label)); the notification is back promptly after a reboot (CCBG-52 (Boot Pin Delay)).
1.8	**Home-screen widgets are back, and accounts show their email.** Four widgets in the picker under **Cooldown** – **Ring**, **Number**, **Countdown** and **All accounts** (CCRM-78 (Widgets Reborn)) – each filling whatever size you place it at, from 1×1 to a full row, painted by the same ring renderer as the status bar (CCRM-83 (Ring Renderer)). Each account shows the **email** it signed in with (CCBG-34 (Account Display Name)); **Clear usage history…** starts an account's trend over (CCRM-14 (Clear History)); **Share snapshot** turns the ring, bars and trend into one image (CCRM-24 (Share Card)). **Fixed:** the two-account notification keeps both names whole (CCBG-24 (Duet Label Clamp)), and turning it on with one account no longer crashes (CCBG-31 (Alert Crash)).
1.7	**The main screen redesigned, the charts polished. Density** – Comfortable, or Compact's tap-to-expand one-line card (CCRM-72 (Main Screen Redesign)) – plus a layout you control: reorder, hide, or fold a card behind **More**, undone by **Reset layout** (CCRM-25 (Card Layout), CCRM-35 (Layout Reset)). One status line replaces Refresh and two timestamps. The 7-day card toggles **All** vs. a per-model cap (CCRM-73 (Model Cap Chart)); guide labels moved inside the plot so the now-line sits under the bar's pace mark, and pace phrases read in **%**, not "points" (CCRM-74 (Chart Polish)). **Chart height** Small / Medium (default) / Large (CCRM-75 (Chart Height)); **Chart orientation** Time across / down (CCRM-77 (Transposed Chart)). Claude's dark theme now sits on true black (CCRM-76 (Black Room)). Accounts redesigned – status line, plan chip, three actions (CCRM-65 (Accounts Redesign)) – with draggable order (CCRM-71 (Account Order)). Usage history gains **Plan Fit** (CCRM-70 (Plan Fit)). The notification is now a **foreground service** (CCRM-67 (Pin Service), fixing CCBG-28 (Pin Sinks)); Refresh survives being offline (fixing CCBG-29 (Refresh Swallowed)); ChatGPT's idle window stopped self-counting (CCBG-30 (Phantom Window)); an honest User-Agent replaces the borrowed CLI one (CCRM-68 (Honest Agent)). **Known:** a narrow account label may still ellipsize (CCBG-24 (Duet Label Clamp)).
1.6	**Two accounts on one notification, Settings on a diet, the Pulse icon.** The always-on notification carries a First and a Second account side by side, with the Weekly rows expanded – the panel now draws at full width whatever it holds, so a warning strip can't shrink the Weekly meters (CCBG-26 (Panel Scaling)). The status-bar ring drops its weekly dot and wears the shown account's colour (First / Second / Whichever is higher), solid red with an × at 100%. Reset pings are per account and per window, and now fire for an idle account too. Settings shrinks to four tabs – Accounts, Alerts, Appearance, More. Every Claude card shows its plan – Free, Pro, Max, Team Standard, Team Premium (CCRM-64 (Claude Plan Tag)) – and a Free account is told plainly it has no usage, not a server error (CCBG-27 (Free Plan 403)). New Pulse launcher tile; each tab is a room (ivory and serif for Claude, neutral for ChatGPT). **Removed:** the home-screen widgets, the Quick Settings tile, the standalone threshold and pace alerts, three notification styles and three status-bar glyphs, and the computer-token backup – sign in on the phone for both services (CCRM-63 (Token Import Removal)) – placed widgets and tiles disappear on update. Fixed: the two provider marks now render the same size.
1.5	**ChatGPT accounts, and the app becomes just "Cooldown".** A ChatGPT account is added from "+ Add account" and signed in with a **short code** at auth.openai.com – no computer, no copied token – then behaves exactly like a Claude one. Each account carries its provider's mark and, by default, its provider's colour, overridable globally or per account. A window an account doesn't have is hidden rather than drawn as a dash. Gemini (Google Antigravity) is listed but greyed out.
1.4	**As many accounts as you use.** Accounts moved to a proper registry – "+ Add account" for a third, fourth, or more, each with its own tab, renamed from its card's ⋮ menu. A clock-hand pace needle on the status-bar gauge. Fixed: alerts switched off in Settings left their strip stuck on screen.
1.3	**A status-bar meter you can read, one alert surface.** The tiny status-bar icon rebuilt around its real rendered size, with a theme-coloured 5-hour ring and a pace line; every alert for every profile folds into the pinned notification's one panel; a new hourglass launcher icon; Used-or-Left and countdown-or-clock display switches; typed error messages and a shareable app log.
1.1–1.2	**Credits, a readable chart, pace everywhere.** Pay-as-you-go **usage credits** on the main screen; a rebuilt **pace chart** with an even-pace line, per-reading dots and threshold guides; the even-pace tick on every bar; automatic update checks. (The widget faces and pace alerts these versions added were retired in 1.6.)
1.0	**First official release.** The v0.1–v0.14 beta, now official: live 5-hour & 7-day windows for Personal + Work, usage history, pinned notification, granular alerts, burn-rate forecast, on-phone sign-in – private, no servers, backed up.
0.12–0.14	**Native sign-in, history, distribution.** "Sign in on this phone" – the PKCE flow Claude Code uses, browser picker included (0.12); usage history, the always-on notification, granular alerts, editable profile names, a permanent signing key (0.13); feedback by email and **Check for updates** against GitHub Releases (0.14).
0.1–0.11	The beta – first widget and app, Material You polish, usage alerts, the 0.5 redesign, two profiles, on-phone poll history with a burn-rate forecast, QR token import, plan badges and sign-in expiry warnings, the **Claude Cooldown** rename.

For the curious

how it's built — and how to rebuild it

For future rebuilds

- Single-module Android project — Kotlin · Jetpack Compose · WorkManager · OkHttp · min SDK 31, target 36. Widgets returned in v1.8 as home-screen AppWidgets, painted by the same ring renderer as the status bar (CCRM-83 (Ring Renderer)); the notification itself is still plain RemoteViews.
- Build (signed release): `JAVA_HOME=/opt/homebrew/opt/openjdk@21 ./gradlew :app:assembleGithubRelease` → APK in `app/build/outputs/apk/github/release/`. Signing reads a gitignored `keystore.properties` + `.jks` at the repo root — back them up; losing them means no more updates.
- The launcher icon is four VectorDrawables on one 108-unit grid (foreground, background, monochrome, and the in-app round copy) — the same ECG geometry in each, so About and the drawer show one picture.
- If Anthropic or OpenAI changes an undocumented response schema, the parsers ignore unknown fields; if bars go blank, check the raw JSON in the Debug section first.

Built by Robin Richard Rajan.

Personal sideloaded app — not on any store, not affiliated with Anthropic, OpenAI or Google. If you'd like the APK or want to build something like this, just ask.
