

# Cooldown

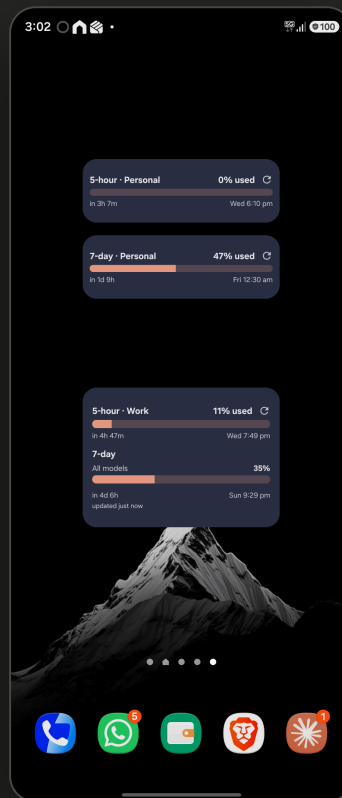

a home-screen companion for people who live in Claude & ChatGPT

# Never get cut off by a usage limit **mid-thought** again.

Claude and ChatGPT both meter you on a 5-hour session window and a 7-day weekly one. Cooldown puts every one of them on your Android home screen – for as many accounts as you use, on either service – forecasts when you'll hit the wall at your current pace, and pings you before it happens *and* the moment you're back.

The app – the pace chart and your usage credits

The widgets – live on your home screen, in your accent color

The tiles – one per account, in the shade, visible from inside any app

CLAUDE + CHATGPT

LIVE WIDGETS

PACE CHART

SMART ALERTS

MULTI-ACCOUNT

NO SERVERS

Built with Claude Code – by two Claude models. Prototyped over a week and **built in a single weekend by Claude Fable 5** (every line of Kotlin, the UI, the widgets). When the sign-in hit a wall Fable wouldn't cross, **Claude Opus 4.8** stepped in to finish it and write the docs. Directed by Robin Richard Rajan – this brochure too.

# What it **does**

## Usage history

A scrollable bar for every 5-hour session, week by week – see how many you ran and which ones hit 100%.

## Pinned notification

Always-on and silent, with a status-bar gauge that fills – in four styles, including one with the percentage as big as it goes.

## The pace chart

Every reading plotted, with a forecast tail: "At this pace: 100% at Thu 2:40 PM – 1h 20m before the reset."

## Granular alerts

Per-window threshold chips, reset pings set off / if-busy / always, and a per-profile mute – quiet when you want, loud when it counts.

## The even-pace line

One diagonal across each chart. Below it you'll finish inside your limit; cross it and the overshoot shades amber.

## Claude and ChatGPT

Pick the service when you add an account, then mix as many as you like – each fully independent, with its own tabs, widgets, tiles and alerts, and its provider's own mark and colour.

## Sign in on the phone

Claude uses the same secure OAuth flow Claude Code does; ChatGPT takes a short code you approve at [auth.openai.com](https://auth.openai.com). Either way: no computer, no copied tokens.

## Usage credits

Pay-as-you-go credits get their own card – spent, total and what's left, or a plain balance on ChatGPT. Plans without them never see it.

## Private & backed up

No servers or telemetry; the token is Keystore-encrypted. History & settings now survive a reinstall (token excluded).

# How it was **made**

Cooldown exists because of one recurring pain: deep in a Claude chat, a Cowork run or a ChatGPT session, the dreaded "*approaching your limit*" – with no idea how close, or when the window resets. Claude Code can tell you; the chat apps can't. The fix: put the answer where your eyes already are.

**Claude Fable 5 built it – in a weekend.** After a week of throwaway prototypes, one weekend turned it real: pushed to git, signed, running on a phone. Fable wrote virtually everything – the app, the Glance widgets, the alert logic, the reverse-engineered usage API.

Then it hit the one wall Fable wouldn't cross: the OAuth **sign-in handshake**, which Fable declined on cybersecurity grounds. **Claude Opus 4.8** stepped in – built the native sign-in the app now uses, and wrote the docs Fable left undone. **Claude Opus 5** shipped v1.1's pace chart and credits, then v1.5's ChatGPT accounts on the same rails. If you pay for Claude, you already have the engineer... or three.

## Want it on your phone?

It's **free & open-source**. Scan the code (or visit [github.com/robineam360/Cooldown](https://github.com/robineam360/Cooldown)), grab the **latest APK** from the Releases page, and follow the **detailed user guide** – install → sign-in → widgets in ~3 minutes. **Android 12+ today; iOS is on the roadmap.**

And if the "built by Claude" part is what got you curious – even better. Bring an idea of your own; it takes fewer evenings than you'd think.
